VOTIRO✓
for Financial Services

Financial data is sensitive.
We make it safe.

Financial institutions handle an overwhelming number of files on a daily basis, many of which are uploaded to shared portals by third-parties and contain highly-sensitive information including PCI and PII. Whether it's a loan document, fund transfer, or even images of checks, you want to provide customers with safe, accessible, and timely financial services — while reducing risk to your company. **Enter Votiro.**

While signature-based AV tools can prevent known threats (and endpoint tools can only respond once the damage is done), they're powerless against zero-day attacks and privacy risks. Votiro sits between you and the types of threats hackers haven't even dreamt about - mitigating malware threats and data privacy risks before they can make headlines and harm consumer trust.

Votiro's Data Detection and Response removes zero-day threats and masks need-to-know data before it ever reaches your endpoints (or the wrong users).

"We chose Votiro because of its unique concept and its known success in stopping any exploit from arriving through the email channel. The Votiro technology really proved its worth for us."

- CISO, Fortune 500 Bank

Remain Compliant and Retain Consumer Trust

From banks and credit unions to a host of other financial institutions, **highly sensitive and sought-after financial data is being exchanged at a pace that is nearly impossible for IT teams to keep up with**. This lack of visibility allows malware and privacy risks to make their way into an organization and cause breaches and extreme reputational damage. Not only that; this lack of oversight leaves organizations open to non-compliance.

Votiro solves these problems.

Compliance regulations like PCI-DSS are in place to protect consumer financial information from unauthorized access, yet many data security solutions can only flag data gaps for follow-up, rather than remedy the issue of exposed PCI and PII in real-time. Unlike these so-called solutions, Votiro seamlessly masks PCI and PII in motion.

Real-time Data Detection and Disarming/Masking

Votiro detects privacy risks **and** known and unknown threats in content attempting to enter your organization, then proactively disarms the file before it ever reaches the endpoint.

Unified Threat and Privacy Analytics for Visibility

Votiro delivers in-depth, actionable privacy and threat insights as content flows in. This enables organizations to **remain compliant** and make the best decisions for their business.

Automated Remediation to Reduce Workloads

Votiro's automatic threat mitigation allows your team to spend less time quarantining and blocking files, while also reducing alerts and false positives. This amounts to less noise in the SOC.

Try Votiro Free for 30 Days

See how Votiro stops threats before they ever reach your endpoint with a **free trial!**
